

Israel Ortiz

Junior Solutions Engineer · Front-End & Config-Driven Forms

israeljortizcpsc@email.com | (540) 498-0854 | Fredericksburg, VA · Open to Remote | [GitHub](#) | [LinkedIn](#) | [Portfolio Website](#)

Front-end builder who turns field requirements into validated, mobile-first forms. I ship config-driven forms in JSON/HTML/CSS, work comfortably in Git, and build day-to-day with Cursor and Claude. Happiest making other people's jobs easier with software that just works.

SELECTED PROJECTS

Derrick — JSON-schema-driven form engine [live demo](#) | [code](#) Built a runtime engine that renders **validated, mobile-first inspection forms from a JSON schema**, modeled on how real config-driven form platforms work. Implemented required / range / pattern **validation and conditional logic** (e.g. *defect found* reveals severity, escalation, and photo upload, and blocks submit until sign-off).

Ran **two unrelated forms** — an OSHA/ASME crane inspection and a job-site daily report — off the same engine with **zero code changes, only new JSON**.

Stack: JSON, HTML, CSS, JavaScript · built in **Cursor with Claude** · **deployed to production** on Vercel.

CSV → Form-Schema Converter [live demo](#) | [code](#) Tool that turns a spreadsheet of field definitions into a valid JSON form schema — mirroring the requirements hand off from a non-technical team to engineering.

Parses 8 field types and flags malformed rows with human-readable errors. **Stack:** JavaScript, HTML/CSS.

Form-Field Design System [live demo](#) | [code](#) Reusable, accessible set of styled form controls (text, select, radio, date, file) with focus / invalid / checked states, inline validation, keyboard navigation, and visible focus. **Stack:** HTML, CSS.

SKILLS

Languages JSON, HTML, CSS, JavaScript

Tools Git & GitHub, Cursor, Claude, Vercel / Netlify

Practices Form validation & conditional logic, responsive / mobile-first design, accessibility basics, AI-assisted development

Learning TypeScript, React, Node.js (keep only what's true for you)

EXPERIENCE

[Solutions Engineer] — [Ambrose] [Apr 2024 – Present] Turned requirements from customer success and clients into **custom forms in JSON, HTML, and CSS** — adding validation, conditional logic, and styling — and cut average delivery from three days to same-day. Shipped changes to production through **Git** with engineering, and wrote clear setup docs that reduced repeat customer questions by ~30%.

[Full-Stack Developer] — [SUCCESS Magazine] [June 2023 – May 2024] Built **end-to-end features with React** on the front end and **Node.js / Express + PostgreSQL** on the back, from spec to deploy.

Implemented form handling, validation, and **REST API integration** in a branch-and-PR Git workflow; resolved 50+ bugs across the codebase.

EDUCATION

[M.Eng. Computer Science, Software Engineering Distinction] — [Virginia Tech] [2023] - 4.0/4.0

[B.S. Computer Science & Economics] — [University of Mary Washington] [2019-2022] - 3.8/4.0
